# Outline

- **Synopsis of GOES-R Product Algorithm**
  - Algorithm description
  - Product example(s)

- **Continuing AWG Validation Activities**
  - Latest algorithm performance statistics obtained
  - Examples (routine and deep-dive)
  - Showcasing of any validation tools developed

- **Thoughts, Plans, and Opportunities for:**
  - Real-time simulated ABI

# Products

- The purpose of the imagery team is two-fold:
  - Demonstrate how to convert from GRB scaled radiances (eg, GRB integers) to other physical units, such as radiance, brightness temperatures and brightness values.
  - Build files that can be used for processing most all of the ABI products, such as clouds, soundings, etc.

- Imagery is the key product for GOES-R.

- There are 54 KPP Cloud and Moisture Imagery End-Products (CMIP) (48 single band End-Products in netCDF format at the resolution native to each band and one multiband product at 2 km resolution in both netCDF & McIDAS Area file formats).
  - 16 products * 1 format (netCDF) * 3 coverage areas (Full Disk, CONUS, Mesoscale) Multiband products: 1 product * 2 formats (netCDF and McIDAS Area)* 3 coverage areas (Full Disk, CONUS, Mesoscale)

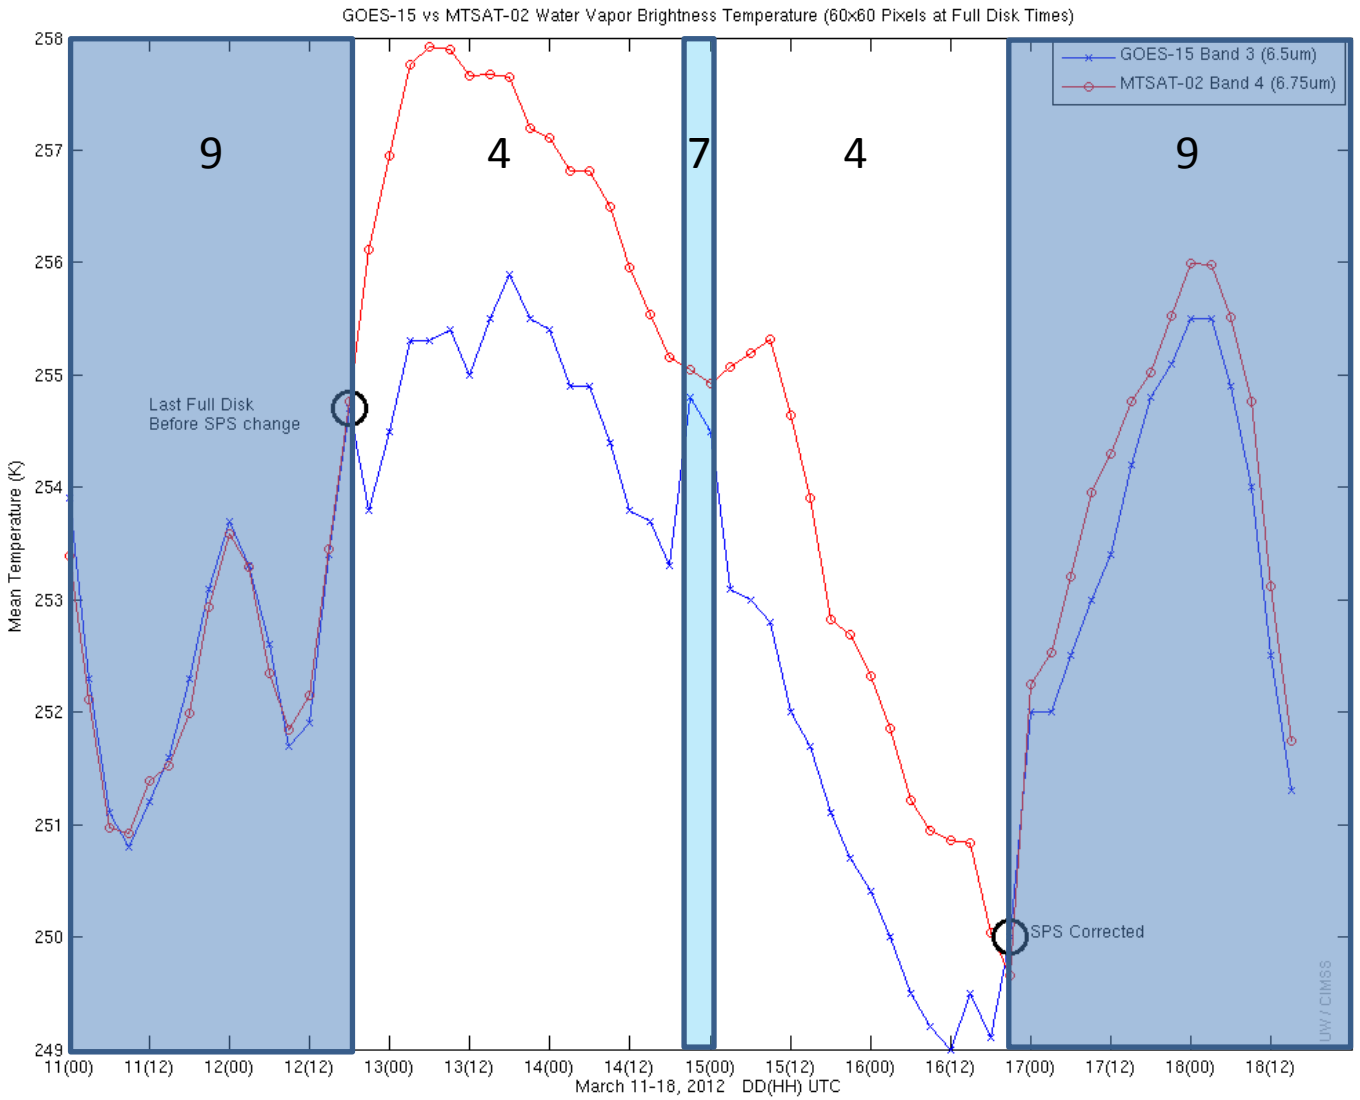
SPS:



*GOES-15 Imager water vapor band compared to co-located MTSAT values. Note large brightness temperature differences beginning near 21UTC on March 12, 2012. Plus, the SPS unit used for the generation of GVAR is noted (obtained from the GVAR signal). Image from: CIMSS and STAR.*

# Routine Validation Tools

This (automated) tool set includes, but is not limited to:

- Time series of reflectance factor (RF) and radiances/brightness temperatures
- Statistics of RF, radiances/brightness temperatures
- Generate a host of images, thumbnail images
- Animations
- Monitor “forward model calc” vs “satellite obs” (Calibration function?)
- Monitor image quality
- Etc.

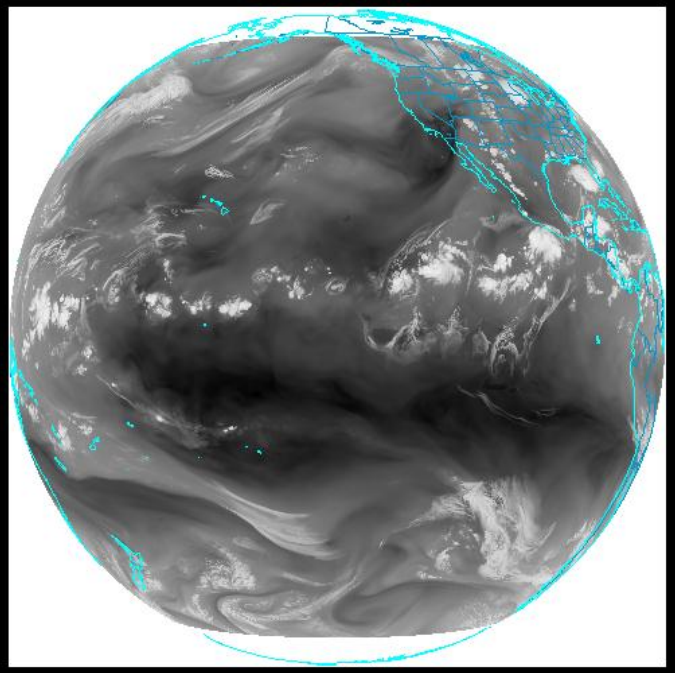
# In ABI FGF (137W)



Working on the Fixed Grid Format (FGF) for ABI

- Iterating with Harris personnel verifying ABI FGF vs CGMS defined “Normalized Geostationary Projection”
- Continued development of beta version of software to compute transforms to and from FGF to longitude and latitude.
- Comparison of earth locations for 2km fixed grid between Harris and SSEC code shows a very close match.
- Continuing effort to define critical metadata for geostationary projections in CF/CF-satellite.

# Outline

  - Algorithm description
  - Product example(s)

- **Continuing AWG Validation Activities**
  - Latest algorithm performance statistics obtained
  - Examples (routine and deep-dive)
  - Showcasing of any validation tools developed

# Summary

- Imagery is the key product and hence needs a sufficient validation tool set.
- This tool set should at least include:
  - Thumbnail images
  - Full size and/or zoomed images
  - Animations
  - Times series of radiances/brightness temperatures
  - Statistics of radiances/brightness temperatures
  - Temporal difference images
  - Spectral band differences
  - Combine images
  - Product generation!
  - Forward model “Calc” vs “Obs” information
  - Etc.
- Need a flexible system, which allows zooming, roaming, specialized enhancements, etc.
  - Hope for the best, plan for the worst.
- Can’t wait for routine GOES-R routine imagery data!
